

Double outlet

DA 50

Main features

- Simultaneous filling from two filling pipes
- Alternate portioning from one nozzle at a time
- Wheeled supporting frame
- Unique hygienic design
- Higher productivity

The double outlet DA 50 is designed for the simultaneous filling and alternate portioning from two filling pipes. IT is simple and easy to attach to the outlet of the REX vacuum filling machine. The two filling nozzles of the DA 50 then make it possible to fill two casing sections simultaneously. The filling process is started with one of the two knee-operated levers at the double outlet. If both nozzles are operated alternately, portioning is also possible. It is very easy to change and fit filling pipes of a wide range of diameters..
